1. Initial dialogue

Start with an introduction, like this one:

"Hi, my name is [name]. I’m an outreach worker with [organization]. I’d love to talk with you about prevention of the new variants of COVID-19, like the Omicron variant. What have you heard about COVID-19 variants?"

Give the participants a chance to respond, then say:

I’d love to discuss this with you, so here are some materials to get our conversation started.

2. Read the fotonovela out loud with the workers

Training Tip

If you’re talking to multiple people, assign them parts and have them act out the script!

3. Discussion

After reviewing the materials, ask one person to give a brief summary of the story.

Then, discuss the following questions. Take time to address any doubts, concerns, or questions that come up.

a. What were you doing to prevent COVID-19 before you got vaccinated (if you’re vaccinated)? What are you doing now?

b. What have you heard about preventing COVID-19 after vaccination?

c. What did you think about the suggestions for prevention that they make in the fotonovela?

d. Do you feel differently about anything after reading the fotonovela?

e. What’s challenging about continuing to prevent COVID-19?
f. What was something new you learned from the fotonovela?
g. What would you like to learn more about?

### Training Tips

- Throughout the discussion, check in with participants and observe their body language to see how they’re feeling.
- Point people to resources so they have reliable information to consult when they feel unsure.
- Offer to continue the conversation with them later, if they need.

### 4. Resources

Before the session, look up the contact information of local people and organizations that can help participants learn more. Write them down here. Then, use these resources to help you answer any questions and to connect people to the services they need.

- **Phone number of a local health center or Department of Health:** 
  

- **Other phone numbers:** 

### 5. Key points

Before finishing, review these key points:

- The COVID-19 vaccine is highly effective at preventing you from getting very sick and spreading the virus.
- The vaccine greatly reduces the risk of getting and spreading the Delta variant, but it is still possible for fully vaccinated people to spread it. That is why it is important to wear a mask when you are indoors or in close contact.
Even if you're fully vaccinated, you need to continue to take preventative measures for yourself and for others.

**Action items!**

Remind participants:
- Even if you're vaccinated, continue to wear your mask, wash your hands, and keep your distance when possible.
- Protect your community!
